

In the Claims:

1. (currently amended) A method in the transmission in a data communications network, particularly Internet, of arbitrarily formatted files comprising one or more different data types, between a sender (1) comprising a data-processing device (2) connected to the data communications network, wherein the sender (1) represents an information provider, and one or more receivers (8) with respective data-processing devices (2) connected with the data communications network, wherein each receiver (8) represents a user, wherein the transmission takes place via a dedicated server (5) provided in or assigned to the data communications network, wherein files which shall be transmitted are stored in a database (3) at the sender (1) or in a database (4) accessible from the sender (1) and which, for the transmission that substantially takes place transparently for both sender (1) and receiver (8) , are downloaded to the data-processing device (2) of the sender (1) , and wherein the method comprises is characterized by processing a file specifically for one or more users with user specific application software for ~~and/or~~ one or more user specific applications under determined conditions, ~~the~~ a specific processing with the user specific application software taking place consecutively in a data processing device (6) of the server (5) during the transmission and/or consecutively in the data-processing device of the receiver (8) as the file is received and/or in the data-processing device of the receiver (8) after the file has

been received; and performing the specific processing with the user specific application software which is stored in one or more of the following: the sender (1) , the server (5) or the receiver (8) , and, as required, is transmitted before or in phase with the processing to an actual processing location.

2. (currently amended) A method according to claim 1,
~~characterized by comprising consecutive or approximately simultaneous~~
~~and/or or interfoliated realized steps for:~~

- a) compression-coding the file which shall be transmitted with a proprietary data compression procedure or a general loss-free data compression procedure,
- b) dividing the compression-coded file in packets,
- c) transmitting the packet-divided compression-coded file to the dedicated server together with receiver addresses,
- d) providing the packets with receiver address, and
- e) transmitting the compression-coded file to one or more receivers (8) according to the receiver addresses of the packets, as well as a further step, for
- f) decoding the received file at the receiver (8) according to the data compression procedure or procedures already used for the compression coding.

3. (currently amended) A method in transmission in a data communications network, particularly Internet, of arbitrarily formatted files comprising one or more different data types, between a sender (1) comprising a data-processing device (2) connected to the data communications network, wherein the sender (1) represents an information provider, and one or more receivers (8) with respective data-processing devices connected with the data communications network; wherein each receiver (8) represents a user, wherein transmission takes place via a dedicated server (5) provided in or assigned to the data communications network, wherein files which shall be transmitted are stored in a database (3) at the sender (1) or in a database (4) accessible from the sender (1) and which for the transmission that substantially takes place transparently for both sender (1) and receiver (8), are downloaded to the data-processing device (2) of the sender (1), and wherein the method comprises ~~is characterized by comprising~~ ~~consecutive or approximately simultaneous and/or interfoliated realized steps for:~~

- a) compression-coding the file which shall be transmitted with a proprietary data compression procedure or a general loss-free data compression procedure,
- b) dividing the compression-coded file in packets,
- e) transmitting the packet-divided compression-coded file to the dedicated server (5) together with receiver addresses,

d) providing the packets with receiver address, and

e) transmitting the compression-coded file to one or more receivers (8) according to the receiver addresses of the packets, and as well as further step, for

f) decoding the received file at the receiver (8) according to the data compression procedure or procedures already used for the compression coding, and

g) additionally processing the files specifically for one or more users with user specific application software and/or for one or more user specific applications under determined conditions, ~~the~~ a specific processing taking place with the user specific application software consecutively in a data-processing device (6) of the server (5) during the transmission and/or consecutively in the data-processing device of the receiver (8) as the file is received and/or in the data-processing device of the receiver (8) after the file has been received, and performing the specific processing with the user specific application software which is stored in one or more of the following: the sender (1), the server (5) or the receiver (8) and which, as required, is transmitted before or in phase with the processing to an actual processing location.

4. (currently amended) A method according to claim 3,

~~characterized by~~ wherein the sender (1) simultaneously with the initialization of the transmission ~~of~~ during or after the transmission to the server (5) sending a message to the receiver (8) with a resource address of the server and an access

code of the server and receiving a confirmation from the server (5) when the latter has received the file and the confirmation from the receiver (8) when the latter has received the file and downloaded it to its data-processing device.

5. (currently amended) A method according to claim 3, wherein the arbitrarily formatted file comprises one or more of the following data types, ~~viz:~~ image data, alphanumeric data, graphic data and fonts, wherein ~~characterized~~ by using the proprietary data compression procedure for compressing image data, and by using the general loss-free compression procedure substantially for compression of alphanumeric data, graphics data and fonts.

6. (currently amended) A method according to claim 3, wherein ~~characterized by~~ storing software for data compression coding and decoding in the server (5) and downloading said software automatically respectively to the data-processing device (2) of the sender (1) for coding the file when the transmission is initialized and to the data-processing device of the receiver (8) for decoding the file when it is received.

7. (currently amended) A method according to claim 3, wherein ~~characterized by~~ the packet division taking place dependent on the data type, such that each packet comprises a determined data type.

8. (currently amended) A method according to claim 3, wherein ~~characterized by~~ the specific processing taking place in the server (5) after a preceding decoding of the file in the server by ~~means of~~ the software for the data compression coding, the software for the specific processing either being stored at the sender (4) and/or at the receiver (8) and being transmitted to the data-processing device (6) of the server (5) when the specific processing shall take place, or beforehand stored in the data-processing device (6) of the server (5) , and after the specific processing again compression-coding the file with software stored in the server (5) for transmission to the receiver (8) , the server (5) on the basis of the receiver address checking whether processing conditions are present.

9. (currently amended) A method according to claim 8, wherein ~~characterized by~~ the processing conditions assigned to a determined receiver address being stored in the server (5) together with software for the processing and being accessed by the server (5) on the basis of the receiver address.

10. (currently amended) A method according to claim 8, wherein ~~characterized by~~ performing the specific processing on one or more determined data types such that only packets comprising the determined data type are decoded before the processing and coded anew after the processing has terminated.

11. (currently amended) A method according to claim 3, wherein
~~characterized by~~ the decoding of the file at the receiver (8) taking place consecutively as
the file is received.

12. (currently amended) A method according to claim 11, wherein
~~characterized by~~ the specific processing taking place consecutively in the data-processing
device of the receiver (8) before and/or after the decoding of the file which is received,
the software for the processing either being stored at the receiver (8) and/or in the sender
(4) and/or in the server (5) and being transmitted to the data-processing device (6) or the
receiver (8) when processing shall take place or beforehand being stored in the data-
processing device of the receiver (8) .

13. (currently amended) A method according to claim 3, wherein
~~characterized by~~ storing the file as it is received in the data-processing device of the
receiver (8), and then decoding the file by the receiver (8) at a later suitably selected
time.

14. (currently amended) A method according to claim 13, wherein
~~characterized by~~ the specific processing of the stored file taking place in the data-
processing device (6) of the receiver (8) before and/or after the decoding of the file, the
software for the processing either being stored at the sender (4) and/or in the server (5)

and transmitted to the data-processing device (6) of the receiver (8) when processing shall take place or beforehand entered in the data-processing device (6) of the receiver (8)

15. (currently amended) A method according to claim 3, wherein ~~characterized by~~ the dedicated server (5) being implemented on a general network server at the sender (1) .

16. (currently amended) A method according to claim 3, wherein ~~characterized in that~~ user names, receiver addresses, files and the given processing conditions assigned to user names or receiver addresses temporarily or permanently are stored in a database (7) provided in the server (5).
